

More QR Code Uses

Add a voice to the QR Code:

When using the web site qrvoicce.net you are able to enter up to a 100 character message that when decoded will be read by a synthesized voice.

You can either type in the message or say the message through a microphone.

Create a QR code in a spreadsheet:

1. In Google Docs open up a new spreadsheet.
2. In Column A, type Web or Url
3. In Column B, type QR Code
4. Resize the row to 100.
5. Leave the column size alone. (If you want your codes to appear larger, then resize the row and columns to a larger number.)
6. In column A type your text or URL that you want your QR code to read when scanned.
7. In Column B insert this formula:
`=image("https://chart.googleapis.com/chart?chs=150x150&cht=qr&chl=" & A2)`

Remember to:

TEST...TEST...TEST

It is important to check your QR codes to make sure they work, even if they worked the first time you use them test them regularly to make sure they urls are still good or that the codes have not become "damaged."

Stay tuned....Next week I'll add more uses to QR codes.
